Presented at ICMI study 23, Panel on Special Education, Macau, June, 2015

Students with Disabilities and Problem Solving Instruction

- Historically, mathematics instruction in special education primarily focuses on rote memorization of facts and computational skills (Baroody & Hume, 1991; Bottge, 1999; Parmar, Cawley, & Miller, 1994; Woodward & Montague, 2000).
- Traditional problem solving methods (e.g., key word) have not led to positive outcomes
 - Example:
 - Jill gave away 6 cookies in the morning. She gave away 2 cookies in the afternoon. How many cookies did she give away that day?” (Kelly & Carnine, 1996, p.5)

Contemporary Education Climate in the U.S.

- Problem solving is central to mathematics reform and articulated in the NCTM (2000) Principles and Standards for School Mathematics (De Corte, Greer, & Verschafel, 1996).
- The Individuals with Disabilities Act (IDEA, 1997, 2004) require that students with disabilities be provided not just access, but meaningful access to the general education curriculum.
- The Adequate Yearly Progress component of No Child Left Behind (NCLB, 2002) has mandated that certain percentages of students with disabilities achieve proficiency on state assessments.
- The Common Core Standards (2012)

Contemporary Education Climate

- Common Core Standards (CCS, Council of Chief State School Officers and National Governors Association, 2010) endorse a focused and coherent curriculum.
 - These standards heavily emphasize conceptual understanding of ideas and the connections between mathematical ideas (Common Core State Standards Initiative [CCSSI], 2012).
 - The CCS emphasize “model with mathematics.”
 - The CCS emphasize higher order thinking and reasoning as well as algebra readiness throughout elementary mathematics
-

Background and Theoretical Framework

- As the outcome of a collaborative work that integrates research-based practices from math education and special education, we have developed an intelligent tutor, PGBM-COMPS, that emphasizes conceptual understanding of multiplicative reasoning at both concrete and symbolic levels.
 - The intelligent tutor draws on three research-based frameworks: data (or statistical) learning from computer sciences, a constructivist view of learning from mathematics education, and Conceptual Model-based Problem Solving (COMPS, Xin, 2012) that generalizes word-problem underlying structures (WP *story-grammar*) from special education.
-

Nurturing Multiplicative Reasoning In Students With Learning
Disabilities In A Computerized Conceptual-Modeling
Environment (NMRSD-CCME) [1]

PGBM-COMPS intelligent tutor

PGBM

(Tzur et al., 2013):

“Please go and bring me...” Cubes and Towers Game

- Establish fundamental mathematical ideas that is critical to MR:
- Understand the concepts of
 - Composite Unit (CU) and
 - Multiplicative Double Counting (mDC)

COMPS

(Xin, 2012):

Conceptual model-based problem solving

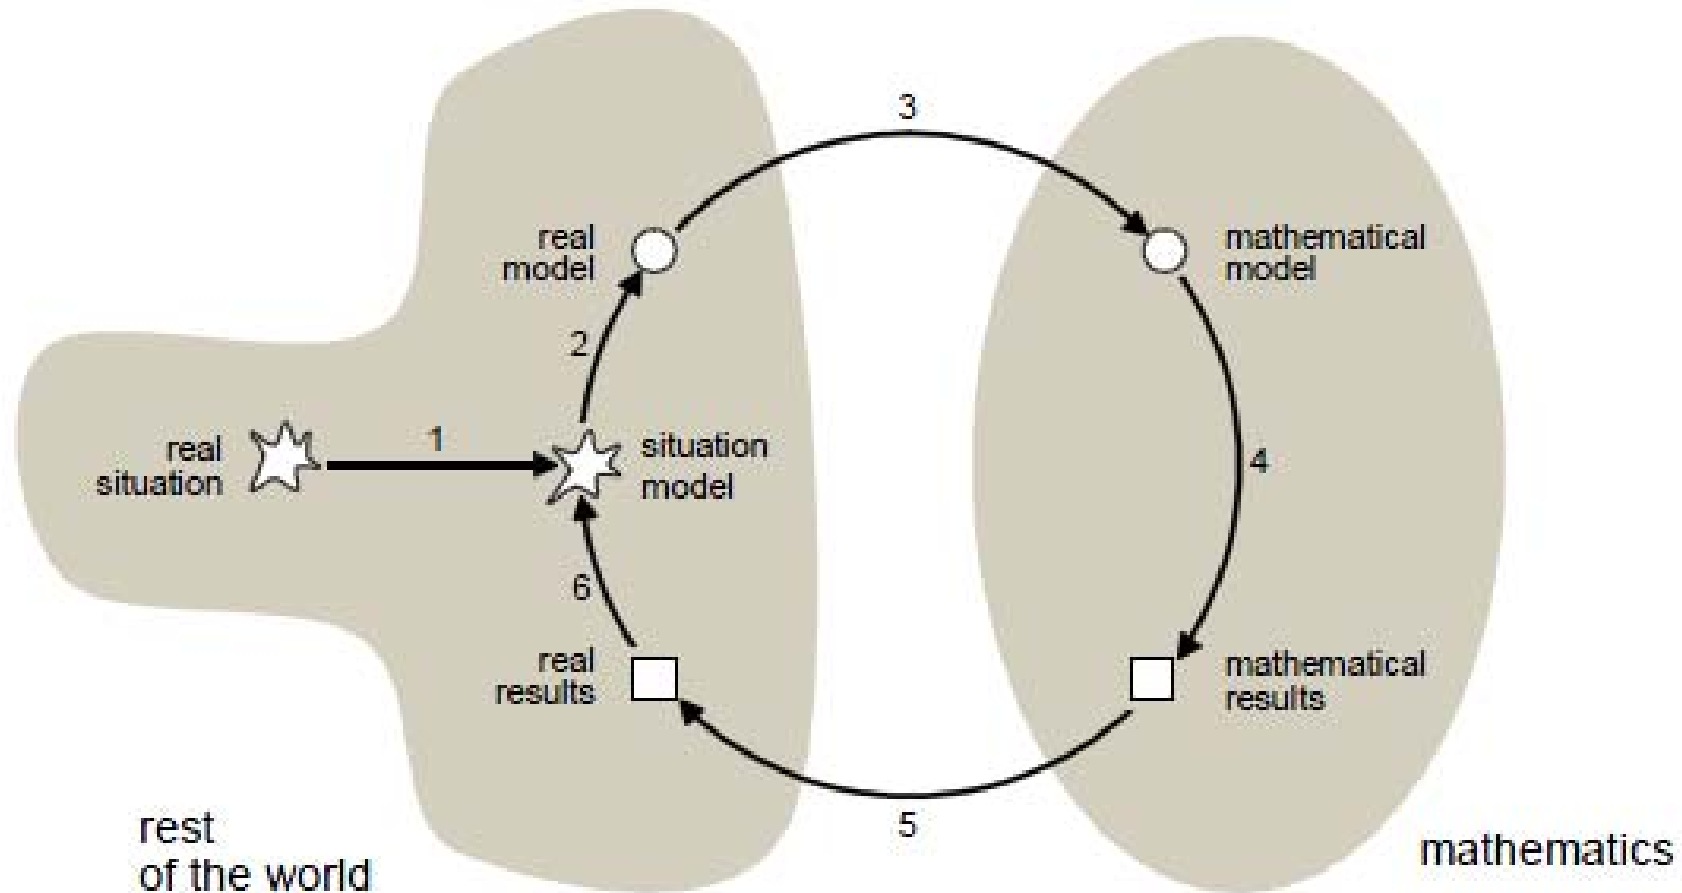

- Make the connection between the concrete model and the symbolic mathematical model/equation (make explicit the reasoning behind MR)
- Facilitate the “mental leap” from real world situated model to mathematical model for solution

Xin, Y. P. (2012). *Conceptual model-based problem solving: Teach students with learning difficulties to solve math problems*. Sense publishers, Boston.

Modeling Cycle (Blum & Leiss, 2005)

Modeling Cycle

- Many students have difficulties in making the transition from a real situational model to a mathematical model;
- It is a weak area in students' mathematical understanding (Blomhøj, 2004).
- While the PGBM part of the program aimed to establish fundamental mathematical ideas through concrete modeling, the COMPS program attempted to facilitate the transition from real-world, situational model to mathematical model.

PGBM-COMPS Intelligent Tutor

| | | |
|--|-----------------|---|
| PGBM MDC: $6T_3$ How many cubes in all? SUC : $6T_3$ vs. $2T_3$ who has more towers? | Module A | COMPS Equal Group (EG) problem structure instruction EG: product unknown |
| PGBM UDS: $6T_3 + 6$ cubes: how many cubes in all? | Module B | MUC: $6T_3 + 12$ cubes = $?T_3$ |
| PGBM QD: Given 36 cubes, how many towers of 9 can you make? | Module C | COMPS EG: #of units unknown and mixed problems |
| PGBM PD: Given 60 cubes; put them in 3T How many cubes in each tower? | Module D | COMPS EG: unit rate unknown and mixed problems |
| MC: Ray has 6 books, and Joe has 8 times as many books as Ray. How many books does Joe have? | Module E | COMPS Multiplicative Compare (MC) and mixed problem solving |

Module A “PGBM” Game

- mDC - Multiplicative Double Counting

PGBM 7T₂; how many cubes in all? 7 x 2

Pretend PGBM 9T₅; how many cubes in all? 9 x 5

The screenshot displays the mDC game interface. On the left, a task box contains the text: "Task: Please go and bring me a tower of 2 cubes. Please go and bring me another tower of 2 cubes. Please go and bring me another tower of 2 cubes. Please go and bring me another tower of 2 cubes." Below the task, it asks "How many towers did you bring?" and provides an answer box with an "OK" button. In the center, a visual representation shows seven vertical towers of varying heights, each composed of small colored cubes. A vertical scale on the right indicates the number of cubes in each tower, with markers at 1, 5, 10, 15, and 20. Below the towers, a "PILE" of yellow cubes is shown, with instructions: "PILE - click to build tower" and "click to remove a cube". On the right, a task box contains the text: "Task: Pretend I asked you to bring 9 towers. Each tower will have 5 cubes. How many cubes will you bring in all?" Below the task, a "Double Counting Mini-tool" is shown, featuring two hands and a grid of 40 numbered boxes (1-40) for counting. A "Start Over" button is also visible. The interface includes a "LogOff" button in the top right corner and a "Page #" indicator.

Module A COMPS

- **COMPS- mDC**

- Use COMPS model to solve various situated product unknown problems involving large quantities

$$\text{UR} \times \# \text{ Units} = ?$$

00 Page #: 134 Layer:11 [LogOff](#)

Please go and bring me 4 towers of 5 cubes each.

15
10
5
1

PILE - click to build tower

click to remove a cube

Every tower has the same number of cubes: cubes

How many times did you bring a tower of 5 cubes? times

[OK](#)

[Cubes](#)

00 Page #: 137 Layer:11 [LogOff](#)

This is an equal group (EG) problem!

5 + 5 + 5 + 5 = 20

5 X 4 = 20

We call the above math sentence:
A multiplication equation.

Module C PGBM

- **QD**

- mDC-QD: Unit Segmenting

- dCSC (division Concept-Symbol Coordination): 40/8

Given 40 cubes, how many towers of 8 can I make?

Page #: 240 qdt2.3

Task:
I have 40 cubes. How many towers of 8 can I make of these before I run out of cubes?
How many towers of 8 can I make?

Your answer:

click to remove a cube

Flags

Page #: 269 qdt1

Task:
There are a total of 12 cubes. If we make towers with 3 cubes in each tower, how many towers would we have?
Please click OK and let me create the towers?

Joo, when you click OK I will build the towers one by one.

OK

Total number of cubes used.

Number of towers built.

12 cubes.

Flags

COMPS Model (Xin, 2012)

- Introduce DOTS Checklist
- Solve more complex real-world problems using conceptual model-based diagram equations.

DOTS checklist

- **D**etect the problem structure.
- **O**rganize the information using EG diagram.
- **T**ransform the diagram into a meaningful math equation.
- **S**olve for the unknown quantity in the question and check your answer.

Students in Mr. Green's class are organizing a total of 112 books onto shelves. If they put 28 books in each shelf, how many shelves will they need to put all the books?

$$\begin{array}{ccccc} \boxed{28} & \times & \boxed{a} & = & \boxed{112} & \text{Answer:} \\ \text{Unit Rate} & & \text{\# of Units} & & \text{Product} & a = \text{ } \end{array}$$

Equation Box

$$\text{ } \times \text{ } = \text{ }$$

Calculator

$$a = \text{ } \text{ } = \text{ }$$

Help

Xin, Y. P., Tzur, R., Si, L., Hord, C., Liu, J., Park, J. Y, Cordova, M., & Ruan, L. Y. (2013, April). A Comparison of Teacher-delivered Instruction and an Intelligent Tutor-assisted Math Problem-Solving Intervention Program. Paper presented at the 2013 AERA, San Francisco, CA.

- The purpose of this study was to compare the effectiveness of the computer-assisted PGBM-COMPS tutoring system (PGBM-COMPS) with school teacher-delivered instruction (TDI) on enhancing the multiplicative reasoning (MR) and problem solving skills of students with LDM.
- Results indicated that there is a statistically significant Group-Time *Interaction* effect (MR: $p < .01$; COMPS: $p < .01$): The improvement rate of the PGBM-COMPS group is much greater than that of the TDI group (on MR measure: Effect Size [ES] = 2.14; on COMPS measure: ES = 2.26)

Figure 1: Performance of the two groups (1 = PGBM-COMPS, 2 = TDI) on the MR test before (Time = 1) and after the intervention (Time = 2, 3, & 4)

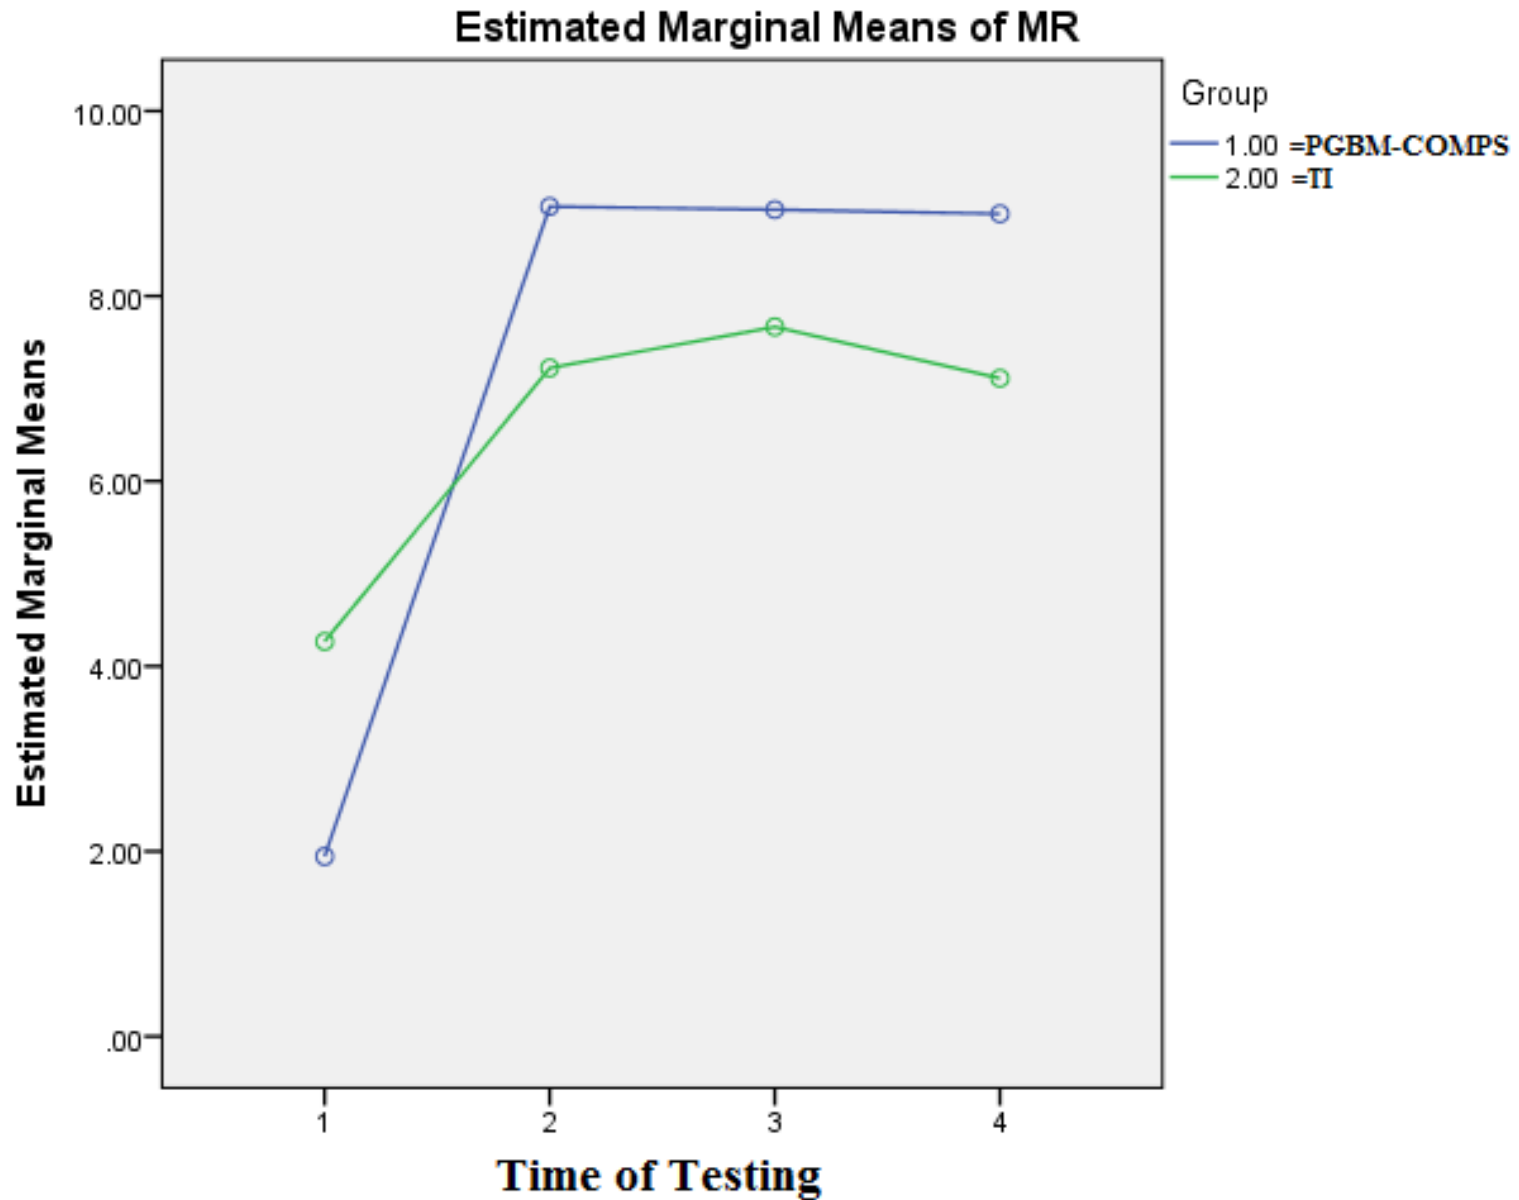

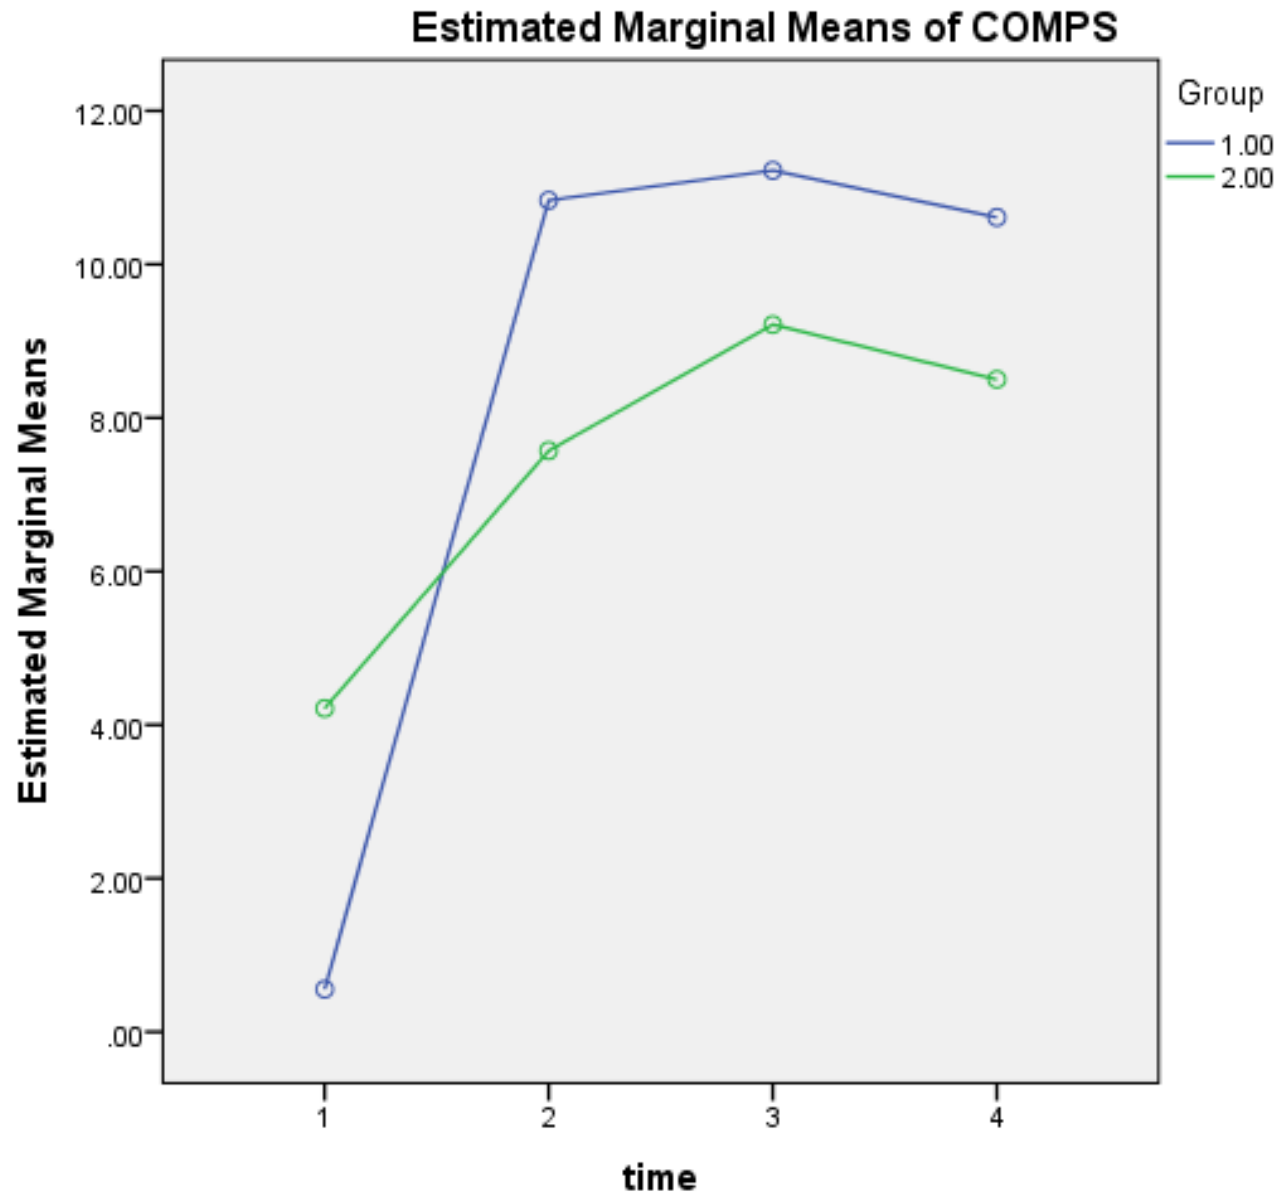

Figure 2: Performance of the two groups (1= PGBM-COMPS, 2 = TDI) on the COMPS test before (Time = 1) and after the intervention (Time = 2, 3, &4)

COMPS Test:
Sample items

Table 2b

Sample Problems in Probes: Multiplication/ Division (from Xin et al., 2008, p. 168)

| Problem type | Sample Problem Situations |
|--------------------------------|---|
| <i>Equal Group</i> | |
| Unit Rate unknown | A school arranged a visit to the museum in Lafayette Town. It spent a total of \$667 buying 23 tickets. How much does each ticket cost? |
| Number of units (sets) unknown | There are a total of 575 students in Centennial Elementary School. If one classroom can hold 25 students, how many classrooms does the school need? |
| Product unknown | Emily has a stamp collection book with a total of 27 pages, and each page can hold 13 stamps. If Emily filled up this collection book, how many stamps would she have? |
| <i>Multiplicative Compare</i> | |
| Compared set unknown | Cameron has 242 marbles. Cameron has a brother named Isaac. Cameron has 22 times as many marbles as Isaac. How many marbles does Isaac have? |
| Referent set unknown | Gina has sent out 462 packages in the last week for the post office. Gina has sent out 21 times as many packages as her friend Dane. How many packages has Dane sent out? |
| Multiplier unknown | It rained 147 inches in New York one year. In Washington D.C., it only rained 21 inches during the same year. The amount of rain in New York is how many times the amount of rain in Washington D.C.? |

Results on Far Transfer Measure

- As for the SAT (Stanford Achievement Test) far-transfer measure, using pretest to posttest *gain* score as the measure, Independent Samples T-test analysis indicates a significant difference between the two groups (COMPS: $M_{\text{gain}} = 10.22$, $SD=8.27$; TDI: $M_{\text{gain}} = 1.86$, $SD=1.39$; $p = .02$) favoring the COMPS group ($ES = 1.41$).

Significance of the Study

- Give that the Common Core demands much deeper content knowledge from teachers of mathematics (CCSSI, 2012), the preliminary findings of this study is encouraging.
- The PGBM-COMPS intelligent tutor, which integrates the best practices from general math education and special education, seems to yield better outcomes in multiplicative problem solving.
- Through the integration of heuristic instruction (that facilitates concept construction) and the explicit model-based problem-solving instruction, it seems that the PGBM-COMPS programs have promoted generalized problem-solving skills of students with LDM.
- This was reflected in students' improved performance on the MR and COMPS criterion tests, and more importantly, on the far transfer measure, SAT, a norm-referenced standardized test.

Concluding Remarks

- Design the teaching/instruction that is built on individual student's learning profile
 - Collect common student responses (e.g., types of thinking) from experimental data
 - Attempt to integrate reasoning and problem-solving competences
 - Invite 'constructivism' into special education discourse – talk about the 'black-box' known as LEARNING
 - **Challenge:** how to make assessment and teaching more intelligent
-
